Introduction Examples How it works? Conclusions

What is a macro-construction?

Definition

In short, it is a tool to learn Dr. Geo new complex constructions.

- It is a set of constructions recorded in one construction instruction. The user defines all the construction set during the construction phase of the macro.
- When a macro is used, all the construction set is realized in one shot. It is the execution phase of a macro.
- The construction set can be recorded in a file, so it can be used later.

Introduction Examples How it works? Conclusions

A bisector, starting situation

Starting situation : three points and two lines. It is about learning Dr. Geo how to construct a bisector given three points.

Introduction Examples How it works? Conclusions

A bisector, expected result

The macro-construction execution over the three points.

3

-

Introduction Examples How it works? Conclusions

Addition of two vectors, starting situation

Starting situation : three points and two vectors. It is about learning Dr. Geo how to construct a vector addition given one point and two vectors.

Introduction Examples How it works? Conclusions

Addition of two vectors, expected result

The macro-construction execution over a point and two vectors.

3

э

-

Introduction Examples How it works? Conclusions

Bisector macro-construction

The user resolves the problem once. For example, using circles to construct two points of the bisector.

Introduction Examples How it works? Conclusions

Bisector macro-construction, construction

Choose the construction tool of the macro-construction

Introduction Examples How it works? Conclusions

Bisector macro-construction, construction

Choose the construction tool of the macro-construction

- Select the three points 1, 2 et 3 as input objects of the macro-construction
- Select the line as the output object
- Set a name and a description to the macro
- Validate the macro-construction

Introduction Examples How it works? Conclusions

Bisector macro-construction, use

- Choose the execution tool of the macro-construction
- Select our macro-construction
- Olick over three points the input objects
- Result : the macro-construction immediately creates the bisector

Introduction Examples How it works? Conclusions

Macro-construction to add two vectors

The user resolves the problem, for example with the translation tool.

Introduction Examples How it works? Conclusions

Macro-construction to add two vectors

The user resolves the problem, for example with the translation tool.

the input objects :
 the point (black and square)
 the two vectors (black)

 the output object, the vector (blue)

Introduction Examples How it works? Conclusions

What to remember?

• Creating a macro-construction it is learning Dr. Geo how to conduct the given constructions.

< 同 ▶

Introduction Examples How it works? Conclusions

What to remember?

- Creating a macro-construction it is learning Dr. Geo how to conduct the given constructions.
- A macro-construction expects input objects.

< 🗇 >

A B M A B M

Introduction Examples How it works? Conclusions

What to remember?

- Creating a macro-construction it is learning Dr. Geo how to conduct the given constructions.
- A macro-construction expects input objects.
- It returns output objects, result of constructions deduced from the input objects.

Introduction Examples How it works? Conclusions

What to remember?

- Creating a macro-construction it is learning Dr. Geo how to conduct the given constructions.
- A macro-construction expects input objects.
- It returns output objects, result of constructions deduced from the input objects.
- All the intermediate objects of the construction are hidden.

Introduction Examples How it works? Conclusions

What to remember?

- Creating a macro-construction it is learning Dr. Geo how to conduct the given constructions.
- A macro-construction expects input objects.
- It returns output objects, result of constructions deduced from the input objects.
- All the intermediate objects of the construction are hidden.
- The macro-constructions are saved on file, individually or in set.

Introduction Examples How it works? Script and macro-constructic Conclusions

What is a script?

Definition

• A script is a function written in the Scheme language.

3

▲ 同 ▶ → ● 三

Introduction Examples How it works? Script and macro-construction Conclusions

What is a script?

- **4** A script is a function written in the Scheme language.
- **2** As a function, it receives input arguments.

Introduction Examples How it works? Script and macro-constructior Conclusions

What is a script?

- A script is a function written in the Scheme language.
- As a function, it receives input arguments.
- Still as a function, it returns value.

Introduction Examples How it works? Script and macro-construction Conclusions

What is a script?

- **1** A script is a function written in the Scheme language.
- As a function, it receives input arguments.
- Still as a function, it returns value.
- This value is alway printed in the sketch. It can be used for the coming after constructions.

Introduction Examples How it works? Script and macro-construction Conclusions

What is a script?

- **1** A script is a function written in the Scheme language.
- As a function, it receives input arguments.
- Still as a function, it returns value.
- This value is alway printed in the sketch. It can be used for the coming after constructions.
- So The input arguments are references to other objects in the current sketch.

Introduction Examples How it works? Script and macro-construction Conclusions

What is a script?

Definition

- A script is a function written in the Scheme language.
- As a function, it receives input arguments.
- Still as a function, it returns value.
- This value is alway printed in the sketch. It can be used for the coming after constructions.
- The input arguments are references to other objects in the current sketch.
- Dr. Geo proposes an API application programming interface – to request information from the objects.

< 17 ▶

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus

Starting situation : two vectors. With the help of a script, we want to compute the dot product of these two vectors.

Introduction Examples How it works? Script and macro-construction Conclusions

Surface calculus and comparison

Starting situation : La saliera of Archimedes. We want to calculate the delimited surfaces. We can use scripts in cascade to achieve these calculus.

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, creating the script

Choose the tool to create script.

/⊒ ► < ∃ ►

э

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, creating the script

Choose the tool to create script.

- In the sketch, select the two vectors as input arguments of the script.
- Click somewhere in the sketch background to set the script there.
- The message Dr. Genius is printed at this place, it is where is anchored the script.

伺 と く ヨ と く ヨ と

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, edit the script

Choose the property tool and click over the script.

< 🗇 >

★ 3 → < 3</p>

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, edit the script

Choose the property tool and click over the script.

🖈 Éditer le scrip	t Scheme	State Street	×
Script			
"Dr. Genius"			
<u></u>			
🔂 Aide	X Annuler	Appliquer	Valider
O Trac	•• Alludia	A Thurdana	↓ Tauraci

Replace the content of the script with :

then apply the modifications.

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, explanations 1/2

- a1 et a2 are the two arguments of the script. These are references to our two vectors.
- getCoordinates is a function returning a list of coordinates.

Introduction Examples How it works? Script and macro-construction Conclusions

Dot product calculus, explanations 2/2

(+ (* (car u) (car v)) (* (cadr u) (cadr v)))) car et cadr get the 1st and 2nd element of the coordinates list : abscissa and ordinate.

Introduction Examples How it works? Script and macro-construction Conclusions

Associate script and macro-construction

This extend Dr.Geo with macro-scripts to :

- calculate the dot product of two vectors
- calculate an algebraic measure
- construct a polygon
- and may others things...

Introduction Examples How it works? Script and macro-construction Conclusions

What to remember?

• A script is a function which returns a value printed in the sketch.

Introduction Examples How it works? Script and macro-construction Conclusions

What to remember?

- A script is a function which returns a value printed in the sketch.
- I receives input arguments, references to other objects in the sketch.

A ►

Image: A image: A

Introduction Examples How it works? Script and macro-construction Conclusions

What to remember?

- A script is a function which returns a value printed in the sketch.
- I receives input arguments, references to other objects in the sketch.
- Dr. Geo proposes an API to request, from a script, information from the objects.

< ∃ >

Introduction Examples How it works? Script and macro-construction Conclusions

What to remember?

- A script is a function which returns a value printed in the sketch.
- I receives input arguments, references to other objects in the sketch.
- Dr. Geo proposes an API to request, from a script, information from the objects.
- The scripts help to extend macro-constructions : it is the *macro-scripts*.

< ∃ >

Introduction Examples How it works? Conclusions

What is a programmed Scheme sketch?

Definition

It is a sketch described in a semi-natural language.

17 ▶

★ ∃ → < ∃</p>

Introduction Examples How it works? Conclusions

What is a programmed Scheme sketch?

Definition

- It is a sketch described in a semi-natural language.
- **2** The computer language is **Scheme**, a variant of **Lisp**.

□→ < □→</p>

Introduction Examples How it works? Conclusions

What is a programmed Scheme sketch?

- It is a sketch described in a semi-natural language.
- **2** The computer language is **Scheme**, a variant of **Lisp**.
- **③** The language allows *iterative* or *recursive* construction.

Introduction Examples How it works? Conclusions

What is a programmed Scheme sketch?

- It is a sketch described in a semi-natural language.
- **2** The computer language is **Scheme**, a variant of **Lisp**.
- S The language allows iterative or recursive construction.
- Or. Geo proposes a well documented API application programming interface.

Introduction Examples How it works? Conclusions

Spiral – Main commands 1/

Code sample

(lets Point "M" free 5 5)

Declare a free point, named M with coordinates (5;5). **lets** is a key word to create an object; the created object is referenced in the variable M.

▲□ ► < □ ► </p>

Introduction Examples How it works? Conclusions

Spiral – Main commands 2/

Code sample			
(let* ((s1	(Segment ""	extremities p1	p2))
(A	(Point ""	on-curve s1	1/10))

let* contains a local variables declaration bloc, the variables scope is the function square.

In this example, the lets keyword is not used, instead functions calls are used to create the geometric objects .

The results of these function calls are affected in the variables s1, A, etc.

Introduction Examples How it works? Conclusions

Spiral – Main commands 3/

Code sam	ple			
(Point		on-curve	s1	1/10)

This call creates a point on the curve s1, with the curve abscissa 1/10.

Whatever the curve type (line, ray, circle, etc), a point belonging to a curve has an abscissa in the range [0;1].

Introduction Examples How it works? Conclusions

< ∃ >

Introduction Examples How it works? Conclusions

Programmed sketch – Some advices

- Use a text editor adapted to the Scheme language here we have used the SciTe editor. Your selected editor must handle at the minimum :
 - syntax highlighting
 - bracket matching there is a lot in Scheme and it is mandatory to use a suited text editor.

Introduction Examples How it works? Conclusions

Programmed sketch – Some advices

- Use a text editor adapted to the Scheme language here we have used the SciTe editor. Your selected editor must handle at the minimum :
 - syntax highlighting
 - bracket matching there is a lot in Scheme and it is mandatory to use a suited text editor.
- Study carefully the Dr. Geo documentation and the examples coming with the documentation.
